

UI OVERHAUL: Order Ticket Fixes (Stock Page Redesign + Options Page Polish + Functional Fixes)

This is one build covering all remaining order ticket issues. Three categories: stock page redesign, options page polish, and functional fixes that apply to both.

PART 1: STOCK ORDER TICKET REDESIGN

The stock order ticket currently looks like plain white text on a black screen. It has no visual energy, no hierarchy, no color. Compare it to the options order ticket which has a color-coded ticker header, strategy summary cards, clear section separation, and visual weight. The stock page needs the same design treatment.

Specific changes:

TICKER HEADER: Match the options page style. Ticker symbol in yellow/gold and bold. Price large and prominent. Change percentage in green (positive) or red (negative). Day range and volume on the same row, smaller. This should look like a trading app header, not a text file.

SIDE TOGGLE (Buy/Sell): Currently a flat, barely visible toggle. Make it prominent. When Buy is selected, the Buy button should be green with white text. When Sell is selected, the Sell button should be red with white text. The inactive option should be a subtle outline or dimmed. This is one of the most important controls on the page and it currently looks like an afterthought.

QUANTITY INPUT: The stepper (+/- buttons with number) is fine functionally. Style it to match the options page quantity stepper. Add the approximate dollar value below it (already showing as "\$231.01" which is good, just make sure it is styled consistently).

ORDER TYPE AND TIME IN FORCE: The Limit/Day dropdowns are fine. Match the styling to the options page (same border treatment, same font, same spacing).

PRICE ROW (Bid/Mid/Ask): Match the options page exactly. Bid in a colored badge (orange/yellow), Mid labeled, Ask on the right. Same font size, same spacing.

NOTIONAL / FEES / BP AFTER TRADE ROW: Good info. Keep it. Just make sure the font and spacing match the options page equivalent row (Total cost / Max risk / Fees).

RISK & INSIGHTS CARD: Currently shows "Pre-trade risk: WARN", "Order vs account size", "Spread 0.0%", and "View full risk details". This is fine but should match the options page Risk Overview card styling. Same card background, same border, same badge styling for PASS/WARN/FAIL.

ORDER DESCRIPTION CARD: "BUY 1 share AMZN at 231.01 Limit, Day" is useful as a plain-English summary. Keep it. Add a subtle card background to give it visual weight instead of floating text.

BALANCES CARD: Buying Power and BP After Trade. Good info. Keep it. Style the card to match the other cards on the page.

OVERALL: The stock page should feel like it belongs in the same app as the options page. Same card styles, same color system, same font hierarchy, same spacing. A user switching between the two via the Options/Stock toggle should feel like they are in the same design system, not two different apps.

PART 2: OPTIONS ORDER TICKET POLISH

The options page is already in good shape after the recent redesign. Minor adjustments only:

FONT SIZE: Increase the base font by approximately 1 point across the entire options order ticket. The current size is just slightly too small. This should not change the layout or cause any section to overflow. If a 1 point increase causes layout issues anywhere, leave that specific element at its current size.

GREEKS: When the Risk Overview card is expanded, the greeks (Delta, Gamma, Theta, Vega) should display in a single horizontal row using abbreviated labels: "D -0.106 G -0.0010 T -0.008 V 0.000". This is already partially working (image shows them in a row) but confirm they are compact and on one line, not wrapping.

PART 3: FUNCTIONAL FIXES (BOTH PAGES)

FIX 1: REVIEW ORDER BUTTON ALWAYS ACTIVE The REVIEW OPTIONS ORDER and REVIEW BUY ORDER buttons are currently disabled/grayed out when the pre-trade risk check returns WARN or FAIL. Remove this gating entirely. The button must always be active and tappable regardless of risk status. PASS, WARN, or FAIL makes no difference. The button is never disabled.

All risk warnings, badges, checklist items, naked position banners, and AI co-pilot tips should still display exactly as they do now. The user sees the information and makes their own decision. The button just cannot block them.

Do not add a separate override button or extra confirmation dialog. Just make the existing button always active.

FIX 2: OPTIONS/STOCK TOGGLE FUNCTIONAL The Options/Stock toggle in the upper right corner of the Order Ticket header is visible but does nothing when tapped. Make it functional.

When on the Options order ticket and the user taps "Stock":

- Switch to the Stock order ticket for the same ticker
- Pre-populate ticker and current price
- Default to Buy, 1 share, Limit order at current bid

When on the Stock order ticket and the user taps "Options":

- Switch to the Options order ticket for the same ticker
- If the user had legs previously configured (came from Strategist or manually built), restore those legs
- If no previous options configuration exists, show the empty leg builder for that ticker

The toggle must preserve the ticker context. The user does not re-enter the symbol.

FIX 3: STOCK PAGE DENSITY Apply the same density and spacing philosophy as the options page. The stock page should not have excessive padding between sections. Everything should fit on one screen without scrolling for a standard single-stock limit order (ticker header, side, quantity, order type, price, risk card collapsed, balances, submit button).

SUCCESS CRITERIA:

1. Stock order ticket looks like it belongs in the same app as the options order ticket. Same design system, same visual quality.
2. Options order ticket font is slightly larger (1 point) without breaking layout.
3. Review/submit button is never disabled on either page regardless of risk status.
4. Options/Stock toggle switches between the two order tickets for the same ticker.
5. Both pages fit their core content on one screen without excessive scrolling.
